LangGraph plans, grounds against schema, generates SQL, then validates or refuses. The model never gets a free path to the database.

LangGraph Django PostgreSQL SELECT-only Allow-lists Read-only tx · timeouts

PROJECT SUMMARY

Natural-language-to-SQL: LangGraph plans, grounds against schema, generates SQL, then validates or refuses. SELECT-only, no SELECT *, allow-lists, read-only transactions, timeouts. Django + PostgreSQL. Built so the model cannot freely hit the database.

github.com/Swapno963/Query-Mind

SAFETY PATH

- Plan → schema → SQL → validate → execute or refuse
- sqlglot AST checks before any query runs
- Table/column allow-lists; repair with a retry cap
- Read-only transaction + statement timeout
